

CS 33

More C

Data Representation, Part 1

Fun with Functions (1)

```
void ArrayDouble(int A[], int len) {  
    int i;  
    for (i=0; i<len; i++)  
        A[i] = 2*A[i];  
}
```

Fun with Functions (2)

```
void ArrayBop(int A[],  
             int len,  
             int (*func) (int)) {  
    int i;  
    for (i=0; i<len; i++)  
        A[i] = (*func) (A[i]);  
}
```

Fun with Functions (3)

```
int triple(int arg) {  
    return 3*arg;  
}
```

```
int main() {  
    int A[20];  
    ... /* initialize A */  
    ArrayBop(A, 20, triple);  
    return 0;  
}
```

Laziness ...

- Why type the declaration

```
void * (*f) (void *, void *);
```

- You could, instead, type

```
MyType f;
```

- (If, of course, you can somehow define *MyType* to mean the right thing)

typedef

- **Allows one to create new names for existing types**

```
typedef int *IntP_t;
```

```
IntP_t x;
```

– means the same as

```
int *x;
```

More typedefs

```
typedef struct complex {  
    float real;  
    float imag;  
} complex_t;
```

```
complex_t i, *ip;
```

And ...

```
typedef void * (*MyFunc_t) (void *, void *);
```

```
MyFunc_t f;
```

```
// you must do its definition the long way
```

```
void *f(void *a1, void *a2) {  
    ...  
}
```

Not a Quiz

- What's A?

```
typedef double X_t[M];  
X_t A[N];
```

- a) an array of N doubles
- b) an MxN array of doubles
- c) an NxM array of doubles
- d) a syntax error

Representing Data in Memory

- **x** is a 4-byte integer
 - how do the 32 bits represent its value?

Unsigned Integers

$$\text{value} = \sum_{i=0}^{w-1} b_i \cdot 2^i$$

Signed Integers

- **Sign-magnitude**

$$\text{value} = (-1)^{b_{w-1}} \cdot \sum_{i=0}^{w-2} b_i \cdot 2^i$$

- **two representations of zero!**
 - **computer must have two sets of instructions**
 - **one for signed arithmetic, one for unsigned**

Signed Integers

- **Ones' complement**
 - negate a number by forming its bit-wise complement
 - » e.g., $(-1) \cdot 01101011 = 10010100$

$b_{w-1} = 0 \Rightarrow$ non-negative number

$$\text{value} = \sum_{i=0}^{w-2} b_i \cdot 2^i$$

$b_{w-1} = 1 \Rightarrow$ negative number

$$\text{value} = \sum_{i=0}^{w-2} (b_i - 1) \cdot 2^i$$

two zeros!

Signed Integers

- **Two's complement**

$b_{w-1} = 0 \Rightarrow$ non-negative number

$$\text{value} = \sum_{i=0}^{w-2} b_i \cdot 2^i$$

$b_{w-1} = 1 \Rightarrow$ negative number

$$\text{value} = (-1) \cdot 2^{w-1} + \sum_{i=0}^{w-2} b_i \cdot 2^i$$

one zero!

Example

- **w = 4**

0000: 0

0001: 1

0010: 2

0011: 3

0100: 4

0101: 5

0110: 6

0111: 7

1000: -8

1001: -7

1010: -6

1011: -5

1100: -4

1101: -3

1110: -2

1111: -1

Signed Integers

- **Negating two's complement**

$$value = -b_{w-1} 2^{w-1} + \sum_{i=0}^{w-2} b_i 2^i$$

- **how to compute $-value$?**
 $(\sim value) + 1$

Signed Integers

- Negating two's complement (continued)

$$value + (\sim value + 1)$$

$$= (value + \sim value) + 1$$

$$= (2^w - 1) + 1$$

$$= 2^w$$

=

Quiz 1

- We have a computer with 4-bit words that uses two's complement to represent negative numbers. What is the result of subtracting 0010 (2) from 0001 (1)?
 - a) 0111
 - b) 1001
 - c) 1110
 - d) 1111

Signed vs. Unsigned in C

- **char, short, int, and long**
 - signed integer types
 - right shift (>>) is arithmetic
- **unsigned char, unsigned short, unsigned int, unsigned long**
 - unsigned integer types
 - right shift (>>) is logical

Numeric Ranges

- **Unsigned Values**

- $UMin = 0$

- $000\dots0$

- $UMax = 2^w - 1$

- $111\dots1$

- **Two's Complement Values**

- $TMin = -2^{w-1}$

- $100\dots0$

- $TMax = 2^{w-1} - 1$

- $011\dots1$

- **Other Values**

- Minus 1

- $111\dots1$

Values for $W = 16$

	Decimal	Hex	Binary
UMax	65535	FF FF	11111111 11111111
TMax	32767	7F FF	01111111 11111111
TMin	-32768	80 00	10000000 00000000
-1	-1	FF FF	11111111 11111111
0	0	00 00	00000000 00000000

Values for Different Word Sizes

	W			
	8	16	32	64
UMax	255	65,535	4,294,967,295	18,446,744,073,709,551,615
TMax	127	32,767	2,147,483,647	9,223,372,036,854,775,807
TMin	-128	-32,768	-2,147,483,648	-9,223,372,036,854,775,808

- **Observations**

$$|TMin| = TMax + 1$$

» Asymmetric range

$$UMax = 2 * TMax + 1$$

- **C Programming**

- **#include** <limits.h>
- declares constants, e.g.,
 - ULONG_MAX
 - LONG_MAX
 - LONG_MIN
- values platform-specific

Quiz 2

- What is $-TMin$ (assuming two's complement signed integers)?
 - a) $TMin$
 - b) $TMax$
 - c) 0
 - d) 1

4-Bit Computer Arithmetic

Signed vs. Unsigned in C

- **Constants**

- by default are considered to be signed integers
- unsigned if have “U” as suffix

0U, 4294967259U

- **Casting**

- **explicit casting between signed & unsigned**

```
int tx, ty;
```

```
unsigned ux, uy; // “unsigned” means “unsigned int”
```

```
tx = (int) ux;
```

```
uy = (unsigned int) ty;
```

- **implicit casting also occurs via assignments and function calls**

```
tx = ux;
```

```
uy = ty;
```

Casting Surprises

- Expression evaluation
 - if there is a mix of unsigned and signed in single expression,
signed values implicitly cast to unsigned
 - including comparison operations <, >, ==, <=, >=
 - examples for $W = 32$: **TMIN = -2,147,483,648** , **TMAX = 2,147,483,647**

Constant ₁	Constant ₂	Relation	Evaluation
0	0U	==	unsigned
-1	0	<	signed
-1	0U	>	unsigned
2147483647	-2147483647-1	>	signed
2147483647U	-2147483647-1	<	unsigned
-1	-2	>	signed
(unsigned)-1	-2	>	unsigned
2147483647	2147483648U	<	unsigned
2147483647	(int)2147483648U	>	signed

Quiz 3

What is the value of

`(long) ULONG_MAX - (unsigned long) -1`

???

- a) -1
- b) 0
- c) 1
- d) `ULONG_MAX`

Sign Extension

- **Task:**

- given w -bit signed integer x
- convert it to $w+k$ -bit integer with same value

- **Rule:**

- make k copies of sign bit:
- $X' = X_{W-1}, \dots, X_{W-1}, X_{W-1}, X_{W-2}, \dots, X_0$

Sign Extension Example

```
short int x = 15213;
int      ix = (int) x;
short int y = -15213;
int      iy = (int) y;
```

	Decimal	Hex	Binary
x	15213	3B 6D	00111011 01101101
ix	15213	00 00 3B 6D	00000000 00000000 00111011 01101101
y	-15213	C4 93	11000100 10010011
iy	-15213	FF FF C4 93	11111111 11111111 11000100 10010011

- **Converting from smaller to larger integer data type**
 - C automatically performs sign extension

Does it Work?

$$val_w = -2^{w-1} + \sum_{i=0}^{w-2} b_i \cdot 2^i$$

$$\begin{aligned} val_{w+1} &= -2^w + 2^{w-1} + \sum_{i=0}^{w-2} b_i \cdot 2^i \\ &= -2^{w-1} + \sum_{i=0}^{w-2} b_i \cdot 2^i \end{aligned}$$

$$\begin{aligned} val_{w+2} &= -2^{w+1} + 2^w + 2^{w-1} + \sum_{i=0}^{w-2} b_i \cdot 2^i \\ &= -2^w + 2^{w-1} + \sum_{i=0}^{w-2} b_i \cdot 2^i \\ &= -2^{w-1} + \sum_{i=0}^{w-2} b_i \cdot 2^i \end{aligned}$$

Unsigned Multiplication

Operands: w bits

u 

$*$ v 

True Product: $2 * w$ bits

$u * v$ 

Discard w bits: w bits

$\text{UMult}_w(u, v)$ 

- **Standard multiplication function**
 - ignores high order w bits
- **Implements modular arithmetic**

$$\text{UMult}_w(u, v) = u \cdot v \bmod 2^w$$

Signed Multiplication

Operands: w bits

u 

$*$ v 

True Product: $2*w$ bits

$u * v$ 

Discard w bits: w bits

$\text{TMult}_w(u, v)$ 

- **Standard multiplication function**
 - ignores high order w bits
 - some of which are different from those of unsigned multiplication
 - lower bits are the same

Power-of-2 Multiply with Shift

- **Operation**

- $u \ll k$ gives $u * 2^k$
- both signed and unsigned

operands: w bits

true product: $w+k$ bits

discard k bits: w bits

- **Examples**

$$u \ll 3 == u * 8$$

$$u \ll 5 - u \ll 3 == u * 24$$

- most machines shift and add faster than multiply
 - » compiler generates this code automatically

Unsigned Power-of-2 Divide with Shift

- Quotient of unsigned by power of 2

- $u \gg k$ gives $\lfloor u / 2^k \rfloor$
- uses logical shift

	Division	Computed	Hex	Binary
x	15213	15213	3B 6D	00111011 01101101
x >> 1	7606.5	7606	1D B6	00011101 10110110
x >> 4	950.8125	950	03 B6	00000011 10110110
x >> 8	59.4257813	59	00 3B	00000000 00111011

Signed Power-of-2 Divide with Shift

- Quotient of signed by power of 2

- $x \gg k$ gives $\lfloor x / 2^k \rfloor$
- uses arithmetic shift
- rounds wrong direction when $x < 0$

	Division	Computed	Hex	Binary
y	-15213	-15213	C4 93	11000100 10010011
y >> 1	-7606.5	-7607	E2 49	1 1100010 01001001
y >> 4	-950.8125	-951	FC 49	1111 1100 01001001
y >> 8	-59.4257813	-60	FF C4	11111111 11000100

Correct Power-of-2 Divide

- Quotient of negative number by power of 2
 - want $\lceil x / 2^k \rceil$ (round toward 0)
 - compute as $\lfloor (x+2^k-1) / 2^k \rfloor$
 - » in C: $(x + (1 \ll k) - 1) \gg k$
 - » biases dividend toward 0

Case 1: no rounding

Biasing has no effect

Correct Power-of-2 Divide (Cont.)

Case 2: rounding

Biasing adds 1 to final result

Why Should I Use Unsigned?

- ***Don't* use just because number nonnegative**

- easy to make mistakes

```
unsigned i;  
for (i = cnt-2; i >= 0; i--)  
    a[i] += a[i+1];
```

- can be very subtle

```
#define DELTA sizeof(int)  
int i;  
for (i = CNT; i-DELTA >= 0; i-= DELTA)  
    . . .
```

- ***Do* use when performing modular arithmetic**
 - multiprecision arithmetic
- ***Do* use when using bits to represent sets**
 - logical right shift, no sign extension
