

# CS 33

## Machine Programming (3)

# IA32 Stack

- Region of memory managed “last-in, first-out”
- Grows toward lower addresses
- Register `%esp` contains lowest stack address
  - address of “top” element

# IA32 Stack: Push

- **pushl *src***
  - fetch operand at *src*
    - » immediate, register, or memory location
  - decrement `%esp` by 4
  - store operand at address given by `%esp`

# IA32 Stack: Pop

- `popl dest`
  - fetch operand from address given by `%esp`
  - put operand in `dest`
    - » register or memory location
  - increment `%esp` by 4

# Procedure Control Flow

- Use stack to support procedure call and return
- **Procedure call:** `call sub`
  - push return address on stack
  - jump to *sub*
- **Return address:**
  - address of the next instruction after call
  - example from disassembly

804854e:	e8 3d 06 00 00	call	8048b90 <sub>
8048553:	50	pushl	%eax

- return address = 0x8048553
- **Procedure return:** `ret`
  - pop address from stack
  - jump to address

# Procedure Call

804854e:	e8 3d 06 00 00	call	8048b90 <sub>
8048553:	50	pushl	%eax

**call 8048b90**

%esp 0x108

%eip 0x804854e

%esp 0x104

%eip 0x8048b90

*%eip: program counter*

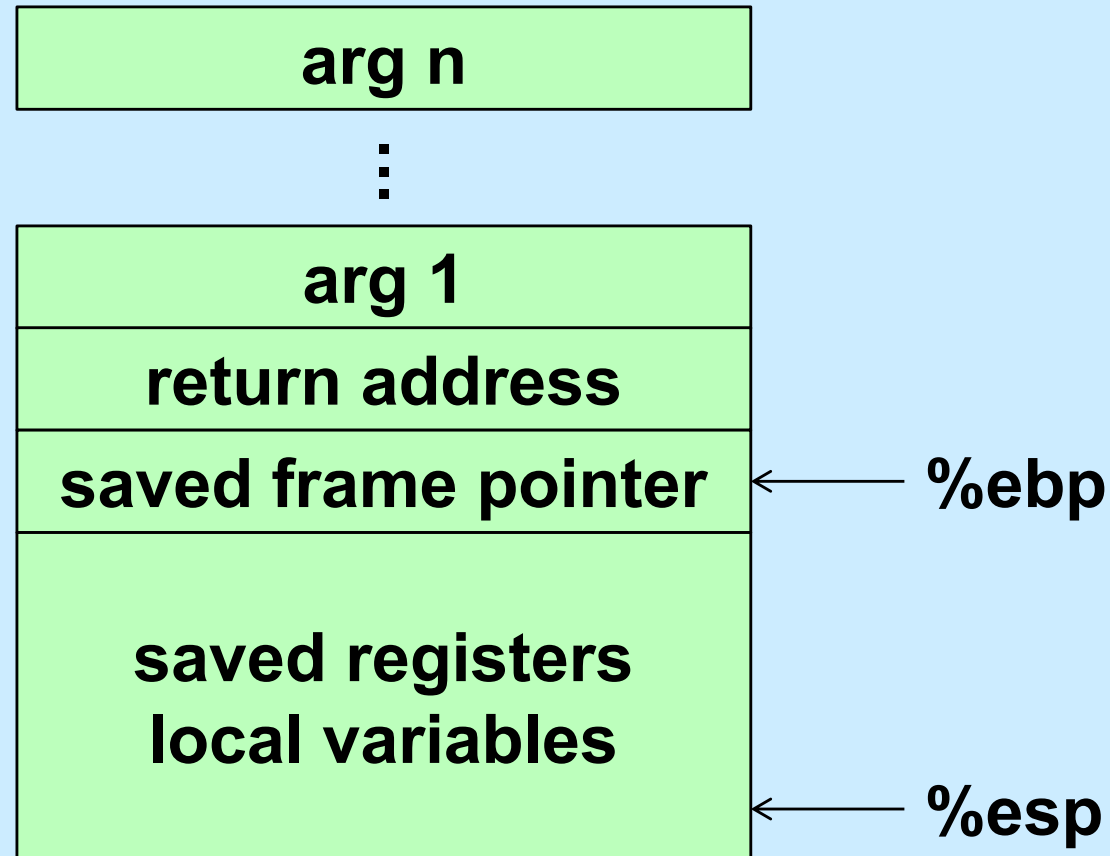

# Procedure Return

```
8048591:    c3                ret
```

*%eip: program counter*

# The IA32 Stack Frame

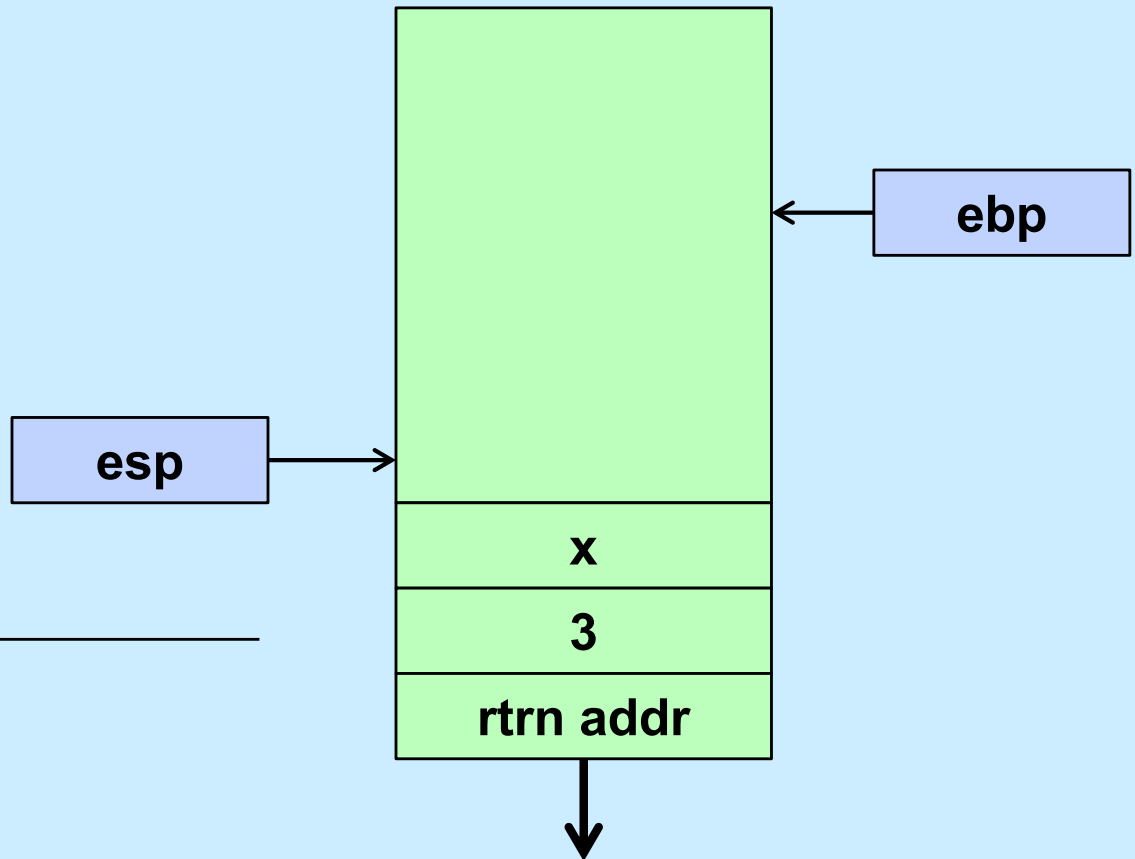

# Passing Arguments

```
int x;  
int res;  
int main() {  
    ...  
    res = subr(3, x);  
    ...  
}
```

---

```
main:  
    ...  
    pushl x  
    pushl $3  
    call subr  
    movl %eax, res  
    ...
```

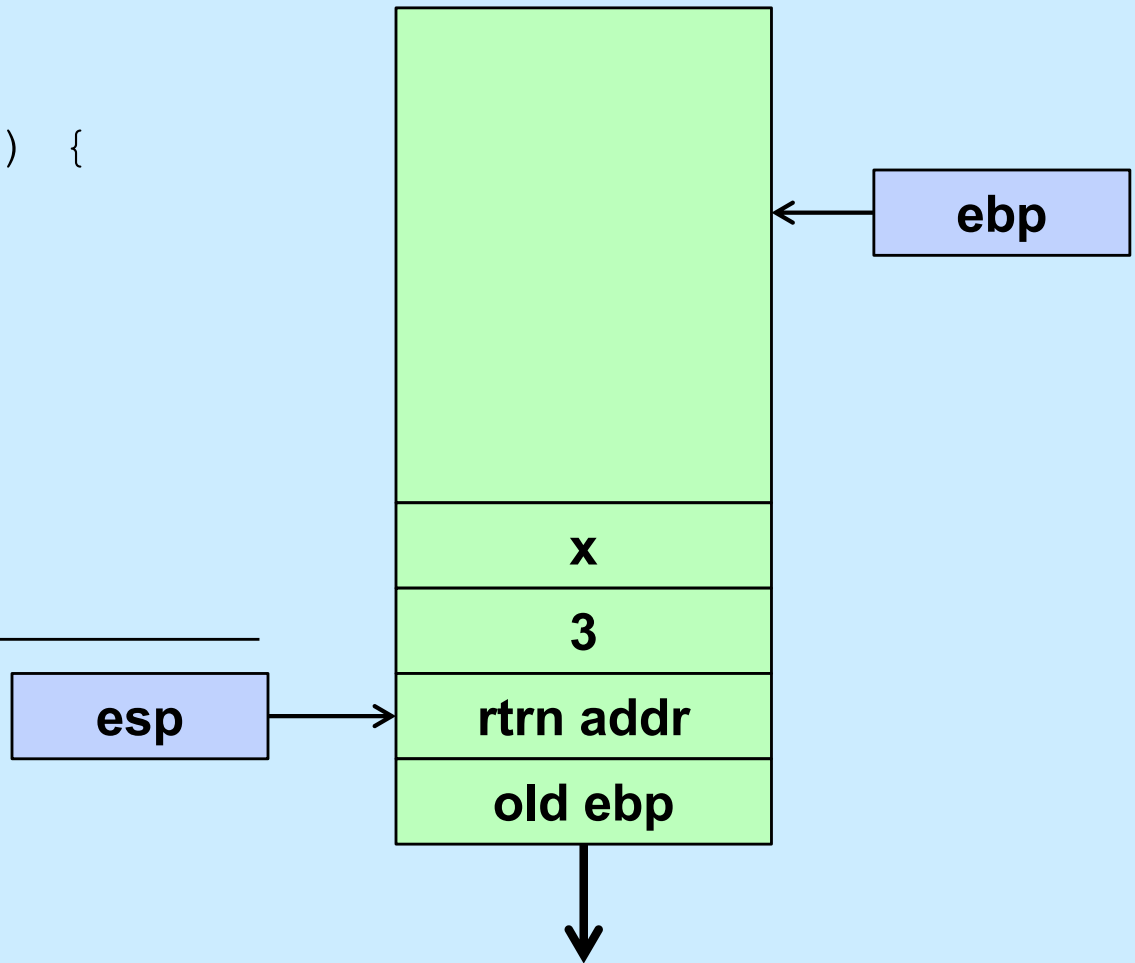

# Retrieving Arguments

```
int subr(int a, int b) {  
    return a + b;  
}
```

---

```
subr:  
    pushl %ebp  
    movl %esp, %ebp  
    movl 12(%ebp), %eax  
    addl 8(%ebp), %eax  
    popl %ebp  
    ret
```

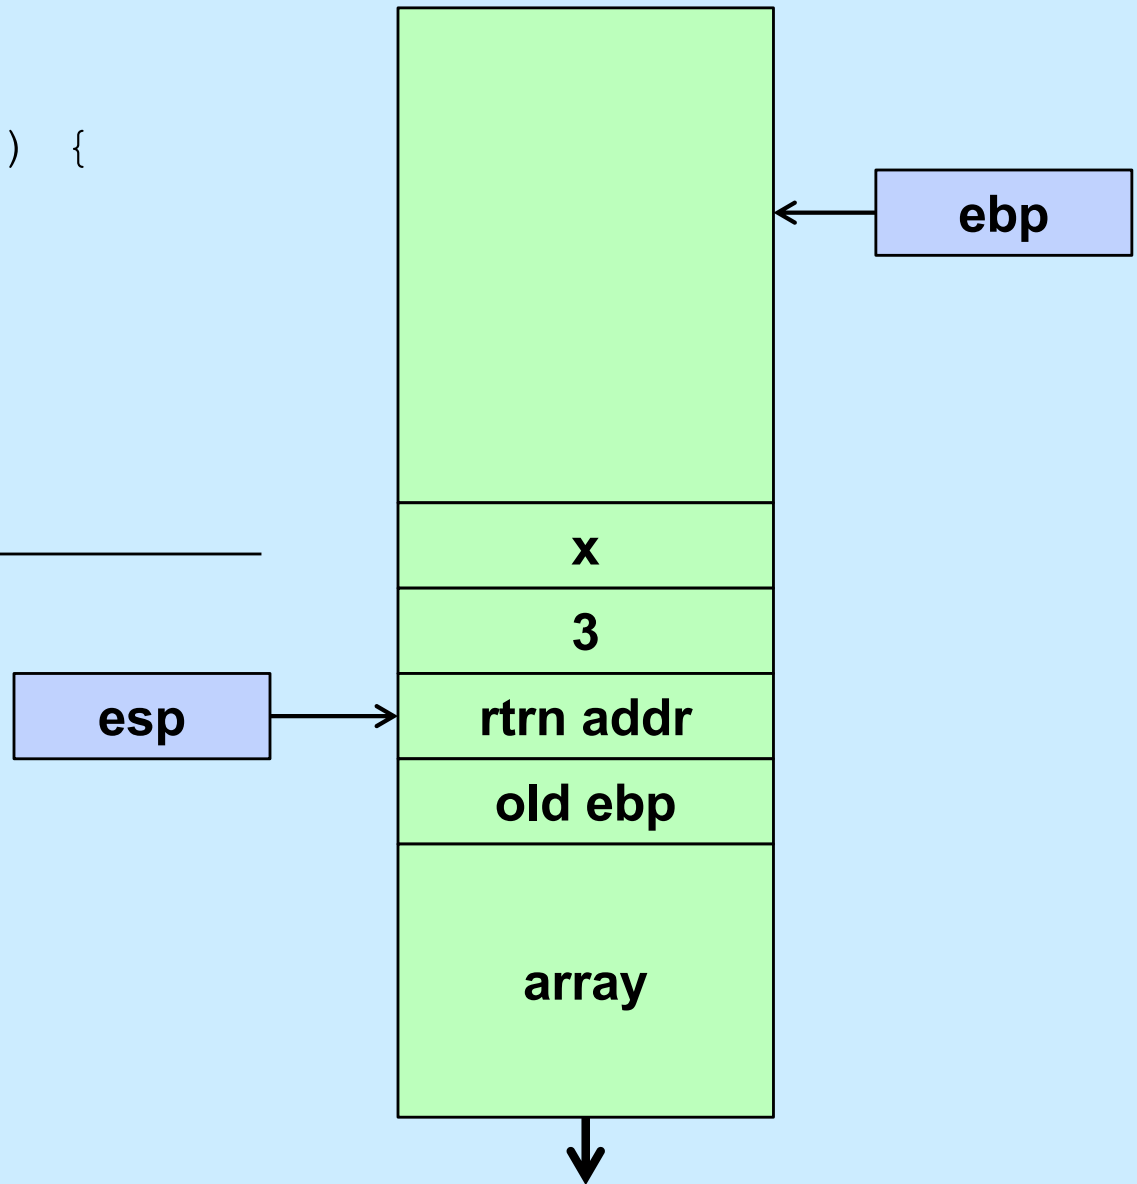

# Space for Local Variables

```
int subr(int a, int b) {  
    int array[20];  
    ...  
}
```

---

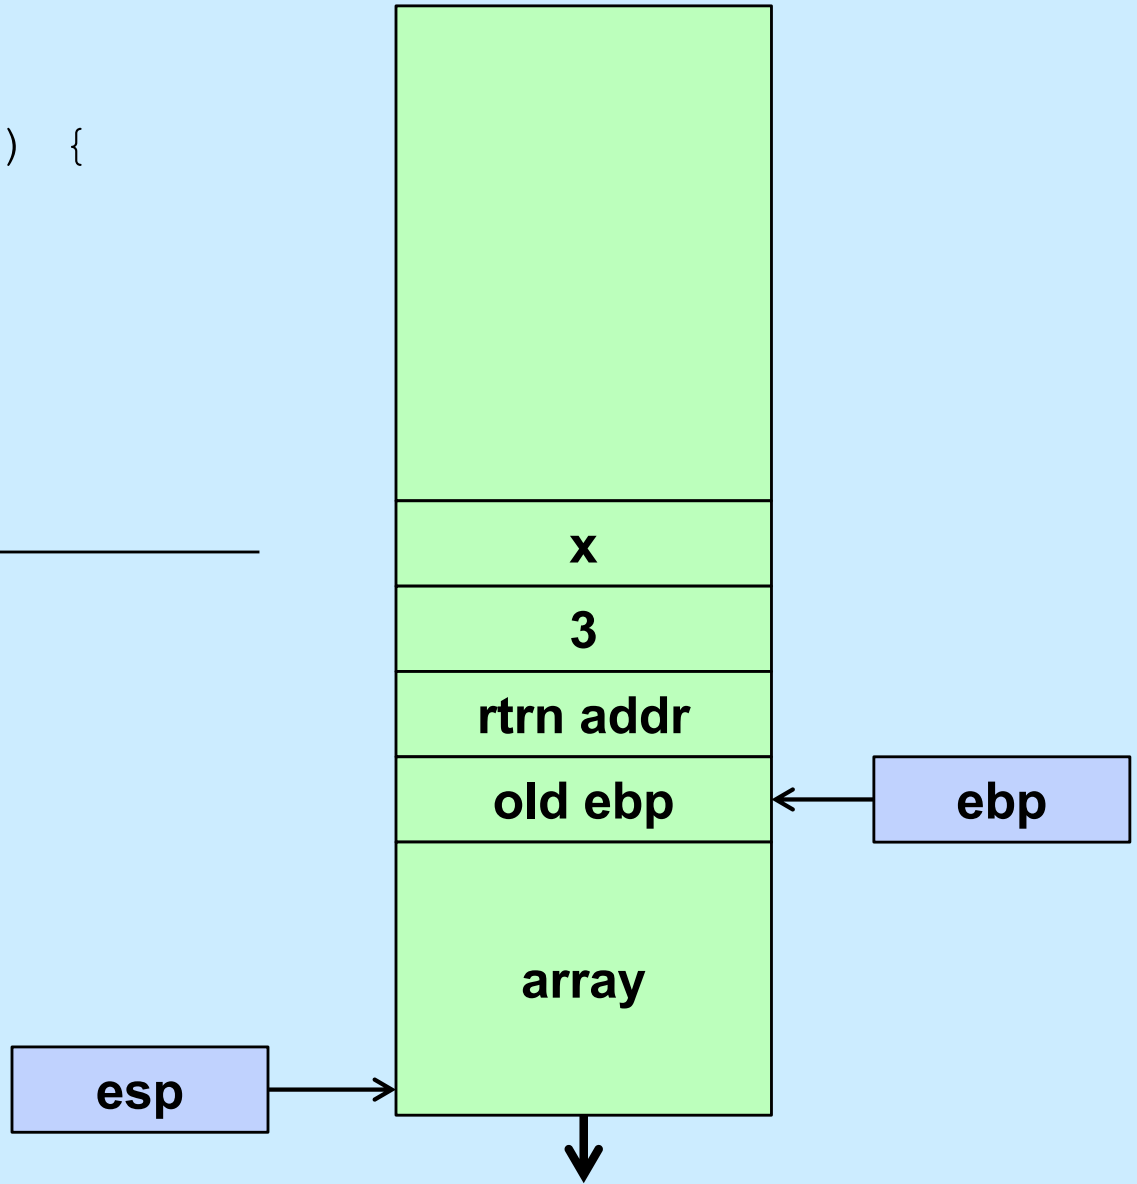

```
subr:  
    pushl %ebp  
    movl %esp, %ebp  
    subl $80, %esp  
    ...  
    addl $80, %esp  
    popl %ebp  
    ret
```

# Quick Exit ...

```
int subr(int a, int b) {  
    int array[20];  
    ...  
}
```

```
subr:
    pushl %ebp
    movl %esp, %ebp
    subl $80, %esp
    ...
    leave
    ret
```

# Register-Saving Conventions

- When procedure `yoo` calls `who`:
  - `yoo` is the *caller*
  - `who` is the *callee*
- Can registers be used for temporary storage?

```
yoo:
    . . .
    movl $33, %edx
    call who
    addl %edx, %eax
    . . .
    ret
```

```
who:
    . . .
    movl 8(%ebp), %edx
    addl $32, %edx
    . . .
    ret
```

- contents of register `%edx` overwritten by `who`
- this could be trouble: something should be done!
  - » need some coordination

# Register-Saving Conventions

- When procedure *yoo* calls *who*:
  - *yoo* is the *caller*
  - *who* is the *callee*
- Can registers be used for temporary storage?
- Conventions
  - “*caller save*”
    - » caller saves registers containing temporary values on stack before the call
    - » restores them after call
  - “*callee save*”
    - » callee saves registers on stack before using
    - » restores them before returning

# IA32/Linux+Windows Register Usage

- **%eax, %edx, %ecx**
  - caller saves prior to call if values are used later
- **%eax**
  - also used to return integer value
- **%ebx, %esi, %edi**
  - callee saves if wants to use them
- **%esp, %ebp**
  - special form of callee-save
  - restored to original values upon exit from procedure

# Register-Saving Example

yoo:

```
...  
movl $33, %edx  
pushl %edx  
call who  
popl %edx  
addl %edx, %eax  
...  
ret
```

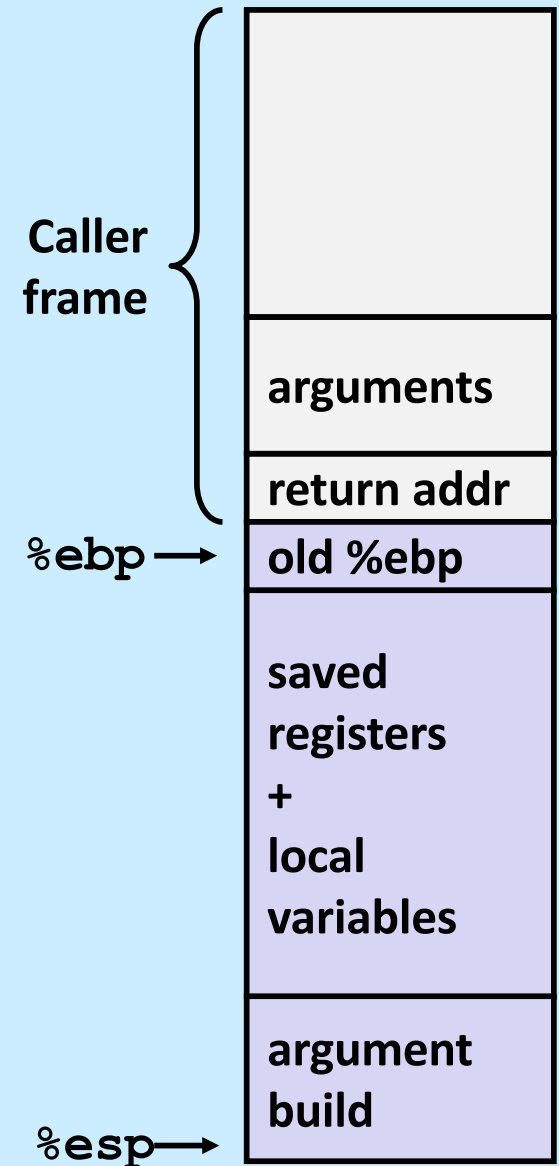

who:

```
...  
pushl %ebx  
...  
movl 4(%ebp), %ebx  
addl %53, %ebx  
movl 8(%ebp), %edx  
addl $32, %edx  
...  
popl %ebx  
...  
ret
```

# Quiz 1

- The leave instruction copies the current value of %ebp into %esp. It's followed by a ret instruction. Does this approach for returning from a procedure work if there are saved registers in the stack frame?
  - a) always
  - b) usually
  - c) never

# Recursive Function

```
/* Recursive popcount */
int pcount_r(unsigned x) {
    if (x == 0)
        return 0;
    else return
        (x & 1) + pcount_r(x >> 1);
}
```

- **Registers**

- **%eax, %edx** used without first saving
- **%ebx** used, but saved at beginning & restored at end

```
pcount_r:
    pushl    %ebp
    movl     %esp, %ebp
    pushl     %ebx
    subl     $4, %esp
    movl     8(%ebp), %ebx
    movl     $0, %eax
    testl    %ebx, %ebx
    je       .L3
    movl     %ebx, %eax
    shrl     $1, %eax
    movl     %eax, (%esp)
    call     pcount_r
    movl     %ebx, %edx
    andl     $1, %edx
    leal     (%edx,%eax), %eax
.L3:
    addl     $4, %esp
    popl     %ebx
    popl     %ebp
    ret
```

# Recursive Call #1

```
/* Recursive popcount */
int pcount_r(unsigned x) {
    if (x == 0)
        return 0;
    else return
        (x & 1) + pcount_r(x >> 1);
}
```

- **Actions**
  - save old value of `%ebx` on stack
  - allocate space for argument to recursive call
  - store `x` in `%ebx`

`%ebx`

`x`

```
pcount_r:
    pushl %ebp
    movl %esp, %ebp
    pushl %ebx
    subl $4, %esp
    movl 8(%ebp), %ebx
    . . .
```

# Recursive Call #2

```
/* Recursive popcount */
int pcount_r(unsigned x) {
    if (x == 0)
        return 0;
    else return
        (x & 1) + pcount_r(x >> 1);
}
```

```
    . . .
    movl    $0, %eax
    testl   %ebx, %ebx
    je      .L3
    . . .
.L3:
    . . .
    ret
```

- **Actions**
  - if  $x == 0$ , return
    - » with `%eax` set to 0

`%ebx` **x**

# Recursive Call #3

```
/* Recursive popcount */
int pcount_r(unsigned x) {
    if (x == 0)
        return 0;
    else return
        (x & 1) + pcount_r(x >> 1);
}
```

- **Actions**
  - store  $x \gg 1$  on stack
  - make recursive call
- **Effect**
  - `%eax` set to function result
  - `%ebx` still has value of  $x$

`%ebx` x

```
...
movl    %ebx, %eax
shrl    $1, %eax
movl    %eax, (%esp)
call    pcount_r
...
```

# Recursive Call #4

```
/* Recursive popcount */
int pcount_r(unsigned x) {
    if (x == 0)
        return 0;
    else return
        (x & 1) + pcount_r(x >> 1);
}
```

```
• • •
movl    %ebx, %edx
andl    $1, %edx
leal    (%edx,%eax), %eax
• • •
```

- **Assume**
  - %eax holds value from recursive call
  - %ebx holds x
- **Actions**
  - compute (x & 1) + computed value
- **Effect**
  - %eax set to function result

%ebx

x

# Recursive Call #5

```
/* Recursive popcount */
int pcount_r(unsigned x) {
    if (x == 0)
        return 0;
    else return
        (x & 1) + pcount_r(x >> 1);
}
```

L3:

```
addl    $4, %esp
popl    %ebx
popl    %ebp
ret
```

- **Actions**

- restore values of %ebx and %ebp
- restore %esp

# Observations About Recursion

- **Handled without special consideration**
  - **stack frames mean that each function call has private storage**
    - » **saved registers & local variables**
    - » **saved return pointer**
  - **register-saving conventions prevent one function call from corrupting another's data**
  - **stack discipline follows call / return pattern**
    - » **if P calls Q, then Q returns before P**
    - » **last-in, first-out**
- **Also works for mutual recursion**
  - **P calls Q; Q calls P**

# Why Bother with a Frame Pointer?

- **It points to the beginning of the stack frame**
  - making it easy for people to figure out where things are in the frame
  - but people don't execute the code ...
- **The stack pointer always points somewhere within the stack frame**
  - it moves about, but the compiler knows where it is pointing
    - » a local variable might be at 8(%rsp) for one instruction, but at 16(%rsp) for a subsequent one
    - » tough for people, but easy for the compiler
- **Thus the frame pointer is superfluous**
  - it can be used as a general-purpose register

# x86-64 General-Purpose Registers: Usage Conventions

<b>%rax</b>	Return value
<b>%rbx</b>	Callee saved
<b>%rcx</b>	Argument #4
<b>%rdx</b>	Argument #3
<b>%rsi</b>	Argument #2
<b>%rdi</b>	Argument #1
<b>%rsp</b>	Stack pointer
<b>%rbp</b>	Callee saved

<b>%r8</b>	Argument #5
<b>%r9</b>	Argument #6
<b>%r10</b>	Caller saved
<b>%r11</b>	Caller Saved
<b>%r12</b>	Callee saved
<b>%r13</b>	Callee saved
<b>%r14</b>	Callee saved
<b>%r15</b>	Callee saved

# x86-64 Registers

- **Arguments passed to functions via registers**
  - if more than 6 integral parameters, then pass rest on stack
  - these registers can be used as caller-saved as well
- **All references to stack frame via stack pointer**
  - eliminates need to update `%ebp/%rbp`
- **Other registers**
  - 6 callee-saved
  - 2 caller-saved
  - 1 return value (also usable as caller-saved)
  - 1 special (stack pointer)

# x86-64 Long Swap

```
void swap_l(long *xp, long *yp)
{
    long t0 = *xp;
    long t1 = *yp;
    *xp = t1;
    *yp = t0;
}
```

**swap:**

```
movq    (%rdi), %rdx
movq    (%rsi), %rax
movq    %rax, (%rdi)
movq    %rdx, (%rsi)
ret
```

- **Operands passed in registers**
  - first (**xp**) in **%rdi**, second (**yp**) in **%rsi**
  - 64-bit pointers
- **No stack operations required (except `ret`)**
- **Avoiding stack**
  - can hold all local information in registers

# x86-64 Locals in the Red Zone

```
/* Swap, using local array */
void swap_a(long *xp, long *yp)
{
    volatile long loc[2];
    loc[0] = *xp;
    loc[1] = *yp;
    *xp = loc[1];
    *yp = loc[0];
}
```

```
swap_a:
    movq    (%rdi), %rax
    movq    %rax, -24(%rsp)
    movq    (%rsi), %rax
    movq    %rax, -16(%rsp)
    movq    -16(%rsp), %rax
    movq    %rax, (%rdi)
    movq    -24(%rsp), %rax
    movq    %rax, (%rsi)
    ret
```

- **Avoiding stack-pointer change**
  - can hold all information within small window beyond stack pointer
    - » 128 bytes
    - » “red zone”

# x86-64 NonLeaf without Stack Frame

```
/* Swap a[i] & a[i+1] */  
void swap_ele(long a[], int i)  
{  
    swap(&a[i], &a[i+1]);  
}
```

- No values held while swap being invoked
- No callee-save registers needed
- **rep** instruction inserted as no-op
  - based on recommendation from AMD
    - » can't handle transfer of control to ret

```
swap_ele:  
    movslq %esi,%rsi          # Sign extend i  
    leaq    8(%rdi,%rsi,8), %rax # &a[i+1]  
    leaq    (%rdi,%rsi,8), %rdi  # &a[i] (1st arg)  
    movq    %rax, %rsi          # (2nd arg)  
    call    swap  
    rep  
    ret
```

# x86-64 Stack Frame Example

```
long sum = 0;
/* Swap a[i] & a[i+1] */
void swap_ele_su
    (long a[], int i)
{
    swap(&a[i], &a[i+1]);
    sum += (a[i]*a[i+1]);
}
```

- Keeps values of `&a[i]` and `&a[i+1]` in callee-save registers
  - `rbx` and `rbp`
- Must set up stack frame to save these registers
  - else clobbered in `swap`

```
swap_ele_su:
    movq    %rbx, -16(%rsp)
    movq    %rbp, -8(%rsp)
    subq    $16, %rsp
    movslq  %esi, %rax
    leaq    8(%rdi, %rax, 8), %rbx
    leaq    (%rdi, %rax, 8), %rbp
    movq    %rbx, %rsi
    movq    %rbp, %rdi
    call    swap
    movq    (%rbx), %rax
    imulq   (%rbp), %rax
    addq    %rax, sum(%rip)
    movq    (%rsp), %rbx
    movq    8(%rsp), %rbp
    addq    $16, %rsp
    ret
```

# Understanding x86-64 Stack Frame

swap\_ele\_su:

<b>movq</b>	<b>%rbx, -16(%rsp)</b>	# Save %rbx
<b>movq</b>	<b>%rbp, -8(%rsp)</b>	# Save %rbp
<b>subq</b>	<b>\$16, %rsp</b>	# Allocate stack frame
<b>movslq</b>	<b>%esi,%rax</b>	# Extend i into quad word
<b>leaq</b>	<b>8(%rdi,%rax,8), %rbx</b>	# &a[i+1] (callee save)
<b>leaq</b>	<b>(%rdi,%rax,8), %rbp</b>	# &a[i] (callee save)
<b>movq</b>	<b>%rbx, %rsi</b>	# 2 <sup>nd</sup> argument
<b>movq</b>	<b>%rbp, %rdi</b>	# 1 <sup>st</sup> argument
<b>call</b>	<b>swap</b>	
<b>movq</b>	<b>(%rbx), %rax</b>	# Get a[i+1]
<b>imulq</b>	<b>(%rbp), %rax</b>	# Multiply by a[i]
<b>addq</b>	<b>%rax, sum(%rip)</b>	# Add to sum
<b>movq</b>	<b>(%rsp), %rbx</b>	# Restore %rbx

<b>addq</b>	<b>\$16, %rsp</b>	# Deallocate frame
<b>ret</b>		

# Understanding x86-64 Stack Frame

```
movq    %rbx, -16(%rsp)
movq    %rbp, -8(%rsp)
```

```
# Save %rbx
# Save %rbp
```

```
subq    $16, %rsp
```

```
# Allocate stack frame
```

• • •

```
movq    (%rsp), %rbx
movq    8(%rsp), %rbp
```

```
# Restore %rbx
# Restore %rbp
```

```
addq    $16, %rsp
```

```
# Deallocate frame
```

## Quiz 2

swap\_ele\_su:

```
movq    %rbx, -16(%rsp)
movq    %rbp, -8(%rsp)
subq    $16, %rsp
movslq  %esi, %rax
leaq    8(%rdi, %rax, 8), %rbx
leaq    (%rdi, %rax, 8), %rbp
movq    %rbx, %rsi
movq    %rbp, %rdi
call    swap
movq    (%rbx), %rax
imulq   (%rbp), %rax
addq    %rax, sum(%rip)
movq    (%rsp), %rbx
movq    8(%rsp), %rbp
addq    $16, %rsp
ret
```

Since a 128-byte red zone is allowed, is it necessary to allocate the stack frame by subtracting 16 from %rsp?

- a) yes
- b) no

```
# Add to sum
# Restore %rbx
# Restore %rbp
# Deallocate frame
```

# Tail Recursion

```
int factorial(int x) {  
    if (x == 1)  
        return x;  
    else  
        return  
            x*factorial(x-1);  
}
```

```
int factorial(int x) {  
    return f2(x, 1);  
}  
  
int f2(int a1, int a2) {  
    if (a1 == 1)  
        return a2;  
    else  
        return  
            f2(a1-1, a1*a2);  
}
```

# No Tail Recursion (1)
